

Answers

A.

According to the mock-up, I noticed two main problems:

1. **Missing Security Code:** There is no field to enter the credit card's security code (CVV/CVC). Without this, the payment gateway will reject the transaction, causing the payment to fail.
2. **Lack of Globalization:** The form is heavily directed towards an American audience, even though the company is global. For example, it includes a "State or Province" field and an "MI" (Middle Initial) field. These fields are not relevant in many other countries and can confuse international users.
3. **Unclear Address Fields:** The Billing Address section has two input fields, but the second line has no label or placeholder. This lack of guidance creates confusion for the user and degrades the overall user experience.

B.

Test Case 1: Verify that a user can successfully submit the payment form with all valid and required data.

Steps:

1. Select a valid Card Type (VISA, Mastercard, etc...).
2. Enter a valid 16-digit Card Number.
3. Select a future Expiration Month and Year.
4. Fill in all mandatory fields (first name, last name, address, city, state, postal code).
5. Click the "Continue" button.

The system processes the input, the form submits successfully without any validation errors, and the user is redirected to a confirmation or success page.

Test Case 2: Verify that the system prevents submission when the selected credit card expiration date is in the past.

Steps:

1. Fill in all mandatory fields with valid data.
2. Select an expiration month and year that have already passed
3. Click the "Continue" button.

The form submission is blocked. A clear, inline error message is displayed near the expiration fields indicating that the card is expired.

C.

The most severe bug is the missing CVV field. is a critical blocker because it prevents the actual processing of secure payments. The Solution is to Add a mandatory text input field labeled "Security Code (CVV)" near the Expiration date section.
